

# QF627 Programming and Computational Finance

## S0304: Data Manipulation and Visualization

### (part 2)

#### Learning Outcomes:

99. ☒ True / ☐ False Both **Python** and **MATLAB** can **use one command** to import data from a CSV file, say **HT001a.csv** (see the screenshot), using the first row as column labels, and the first column as row labels and store the data in a variable with the name **data**.

<u>Python</u>	
	<code>data=pd.read_csv('HT001a.csv', index_col=0, header=0)</code>
<u>MATLAB</u>	
	<code>data=readtable('HT001a.csv', ReadrowNames, true, 'ReadVariableNames', true)</code>

100. If the `filename` is `newfolder\newfile.csv`, we need to use the string as follows:

<u>Python</u>		
<b>Windows:</b>	Method 1:	<code>data=pd.read_csv('newfolder\\newfile.csv')</code>
	Method 2:	<code>data=pd.read_csv(r'newfolder\newfile.csv')</code>
<b>Mac:</b>		<code>data=pd.read_csv('newfolder/newfile.csv')</code>
<u>MATLAB</u>		
<b>Windows:</b>		<code>data=readtable('newfolder\newfile.csv')</code>
<b>Mac:</b>		<code>data=readtable('newfolder/newfile.csv')</code>

101. ☒ True / ☐ False **Python DataFrame** is a dict-like containers of Series. Duplicate **column labels** are not allowed. With the parameter **mangle\_dupe\_cols=True** (default value), duplicate columns will be specified as **X**, **X.1**, ... **X.N**, rather than **X**, ..., **X**. Numbers can be used as column names, e.g. **1**. However, duplicate row names are allowed. For example, for the CSV file **HT001b.csv**, the DataFrame **data** obtained from **pandas.read\_csv** has the following column labels and row labels.

<code>data.columns</code>	<code>Index(['b', 'a.1', 'd e', '1'], dtype='object')</code>
<code>data.index</code>	<code>Int64Index([2, 4, 3, 4], dtype='int64', name='a')</code>

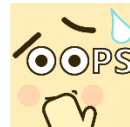

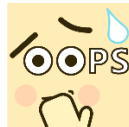

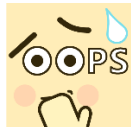

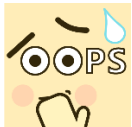

102. ☒ True / ☐ False **MATLAB tables** do not allow duplicate column names (a.k.a. variable names) or row names. Column/Variable names must be a valid identifier. For example, **'1'** and **'d e'** cannot be used as a column/variable name. Function **readtable** will automatically convert them to **'x1'** and **'dE'**. However, **'1'** can be used as a row name. After loading **data** from **HT001b.csv** using **readtable**, column labels and row labels are as following:

<code>data.Properties.VariableNames</code>	<code>{'b' 'a' 'dE' 'x'}</code>
<code>data.Properties.RowNames</code>	<code>{'2', '4', '3', '4_1'}</code>

103. ☒ True / ☐ False Both Python and MATLAB can use **position-based indexing/slicing** method to select data in **data**.

Python	MATLAB
<p><b>data</b></p> <pre> b a.1 de 1 a 2 1 2 3 4 4 5 6 7 8 3 9 8 7 6 4 5 4 3 2 </pre>	<p><b>data</b></p> <pre> data =       b      a      dE      x1       --      --      --      -- 2      1      2      3      4 4      5      6      7      8 3      9      8      7      6 4_1    5      4      3      2 </pre>
<p><b>data.iloc[0,0]</b></p> <pre> Out[7]: 1 </pre>	<p><b>data(1,1)</b></p> <pre> ans =       1 </pre>
<p><b>data.iloc[0:2,0:2]</b></p> <pre> b a.1 a 2 1 2 4 5 6 </pre>	<p><b>data(1:2,1:2)</b></p> <pre> ans =       1      2       5      6 </pre>
<p><b>data.iloc[0,:]</b></p> <pre> b      1 a.1    2 de     3 1      4 Name: 2, dtype: int64 </pre>	<p><b>data(1,:)</b></p> <pre> ans =       1      2      3      4 </pre>
<p><b>data.iloc[:,0]</b></p> <pre> a 2 1 4 5 3 9 4 5 Name: b, dtype: int64 </pre>	<p><b>data(:,1)</b></p> <pre> ans =       1       5       9       5 </pre>
<p><b>data.iloc[[2,0],[0:1]]</b></p> <pre> b a.1 a 3 9 8 2 1 2 </pre>	<p><b>data([3,1],[1:2])</b></p> <pre> ans =       9      8       1      2 </pre>

104. ☐ True / ☒ False In Python, `data.values` returns the whole DataFrame as a 2D Numpy ndarray. In MATLAB, `data{:, :}` returns the whole table as a 2D array/matrix.
105. ☒ True / ☐ False Both Python and MATLAB can use **label-based indexing/slicing** method to select data in `data`.

106. (Python) Add a column of 1s to **data** with column name **f1**.

<code>data['f1']=1</code>
<code>data.loc[:, 'f1']=1</code>

107. (Python) Add a column of integers 0, 1, 2, 3 to **data** with column name **f2** through a Python basic iterable, such as **range**, **list**, etc.

<code>data['f2']</code> or <code>data.loc[:, 'f2']</code>	=	Using <b>range</b>	<code>range(4)</code>
		Using <b>list</b>	<code>[0,1,2,3]</code>
			<code>[[0], [1], [2], [3]]</code>

108. (Python) Add a column of integers 0, 1, 2, 3 to **data** with column name **f3** through a Numpy ndarray generated by **numpy.arange**.

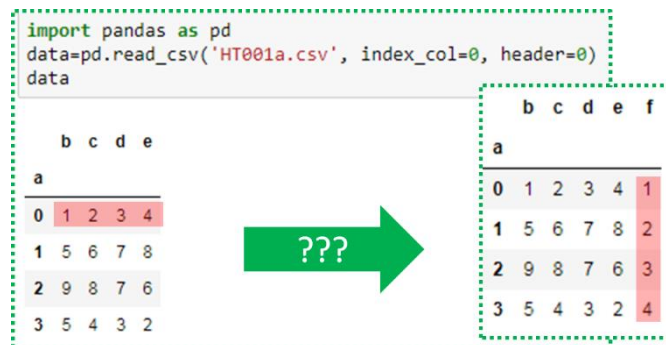

<code>data['f3']</code> or <code>data.loc[:, 'f3']</code>	=	<code>np.arange(4)</code>
		<code>np.arange(4).reshape(4,1)</code>

109. (Python) To add a column to **data** through a Series, we have the following results:

<pre>data=pd.read_csv('HT001b.csv', index_col=0, header=0) data</pre>																																															
<pre>       b  a.1  d e  1 a 2  1    2    3  4 4  5    6    7  8 3  9    8    7  6 4  5    4    3  2</pre>																																															
<code>data['f4']=</code> or <code>data.loc[:, 'f4']=</code>																																															
<table> <tr> <th colspan="6">pd.Series(range(3))</th></tr> <tr> <th></th><th>b</th><th>a.1</th><th>d e</th><th>1</th><th>f4</th></tr> <tr> <th>a</th><td colspan="5"></td></tr> <tr> <th>2</th><td>1</td><td>2</td><td>3</td><td>4</td><td>2.0</td></tr> <tr> <th>4</th><td>5</td><td>6</td><td>7</td><td>8</td><td>NaN</td></tr> <tr> <th>3</th><td>9</td><td>8</td><td>7</td><td>6</td><td>NaN</td></tr> <tr> <th>4</th><td>5</td><td>4</td><td>3</td><td>2</td><td>NaN</td></tr> </table>						pd.Series(range(3))							b	a.1	d e	1	f4	a						2	1	2	3	4	2.0	4	5	6	7	8	NaN	3	9	8	7	6	NaN	4	5	4	3	2	NaN

111. ☒ True / ☐ False Homework question: (Python) Use one command to add a column to **data**, using the first row of **data**, and name this column **f**.

112. Complete the following diagram:

113. (MATLAB) Add a column of 1s to **data** with column name **f1**.

<code>data.f1(:,1)=1</code>	<code>data(:, 'f1')=1</code>	<code>data(:, 'f1')={1}</code>
-----------------------------	------------------------------	--------------------------------

114. (MATLAB) Add a column of integers 0, 1, 2, 3 to **data** with column name **f2** through a Python basic iterable, such as **range**, **list**, etc.

<code>data.f1=[1;2;3;4]</code>	<code>data.f1(:, 1)=[1;2;3;4]</code>
<code>data.f1(:,1)=1:4</code>	<code>data(:, 'f1')=[1;2;3;4]</code>

115. ☒ True / ☐ False Homework question: (MATLAB) Use one command to add a column to **data**, using the first row of **data**, and name this column **f**.

```
data=readtable('HT001a.csv','ReadRowNames',true,'ReadVariableNames',true)
????????????????????????????
```

data =

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2

data =

	b	c	d	e	f
0	1	2	3	4	1
1	5	6	7	8	2
2	9	8	7	6	3
3	5	4	3	2	4

116. (Python) To **use one command** to add a row of 1s to **data** with the row name 100, we can use

```
data.loc[100, :]=1 or
data=data.append(pd.DataFrame(1,
                               columns=data.columns,
                               index=[100]))
```

117. (Python) To **use one command** to add a row of numbers, say 1, 2, 3 and 4, to **data** with the row name 100, we can use

```
data.loc[100, :]=range(1, 5) or
data=data.append(pd.DataFrame(np.arange(1, 5).reshape(1,4),
                               columns=data.columns,
                               index=[100]))
```

118. ☒ True / ☐ False (Python) `pandas.DataFrame.append(other,...)` appends rows of *other* to the end of the dataframe and returns a new object. Columns not in this frame are added as new columns. Some examples are given as follows.

```
import pandas as pd
```

```
data=pd.read_csv('HT001a.csv', index_col=0, header=0)
```

```
print(data)
```

```

   b  c  d  e
a
0  1  2  3  4
1  5  6  7  8
2  9  8  7  6
3  5  4  3  2
```

```
data=data.append([k:v for (v,k) in enumerate(data.columns,1)], ignore_index=True)
```

**data**

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2
4	1	2	3	4

```
data=data.append([k:v for (v,k) in enumerate(data.columns,1)], ignore_index=False)
```

**data**

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2
0	1	2	3	4

```
data=data.append([k:v for (v,k) in enumerate(data.columns,1)], ignore_index=True)
```

**data**

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2
4	1	2	3	4

```
data=data.append(pd.Series(range(1,5),index=data.columns), ignore_index=True)
```

**data**

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2
4	1	2	3	4

```
data=data.append([pd.Series(range(1,5),index=data.columns)], ignore_index=False)
```

**data**

	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2
0	1	2	3	4

```
data=data.append([pd.Series(range(1,5),index=data.columns)], ignore_index=True)
```

**data**

	b	c	d	e
0	1	2	3	4

2	9	8	7	6
3	5	4	3	2
4	1	2	3	4

119. (MATLAB) To **use one command** to add a row of 1s to **data** with the row name 100, we can use `data{'100', :}=1` or `data('100', :)=1`.
120. (MATLAB) To **use one command** to add a row of numbers, say 1, 2, 3 and 4, to **data** with the row name 100, we can use `data{'100', :}=[1,2,3,4]` or `data{'100', :}=1:4`.
121. (Python) To **use one command** to delete column **b** in **data** we can use `del data['b']` or `data.drop('b', axis=1, inplace=True)`.
122. (Python) To **use one command** to delete the **n**th column in **data** we can use `del data[data.columns[n-1]]` or `data.drop(data.columns[n-1], axis=1, inplace=True)`.
123. (Python) To **use one command** to delete row **b** in **data** we can use `data.drop('b', axis=0, inplace=True)`.
124. (Python) To **use one command** to delete the **n**th row in **data** we can use `data.drop(index[n-1], inplace=True)`.
125. (MATLAB) To **use one command** to delete a column **b** in **data** we can use `data.b=[]` or `data(:, 'b')=[]`.
126. (Python) To **use one command** to delete the **n**th column in **data** we can use `data(:, n)=[]`.
127. (Python) To **use one command** to delete a row **b** in **data** we can use `data('b', :)=[]`.
128. (Python) To **use one command** to delete the **n**th row in **data** we can use `data(n, :)=[]`.
129. (Python) We can use the following code to swap the objects bounded by **a** and **b** respectively.

<pre>a=1 b=2</pre>	
<pre>#Solution 1 temp=a a=b b=temp</pre>	<pre>#Solution 2 a,b=b,a</pre>

130. (MATLAB) We can use the following code to swap the values stored in **a** and **b** respectively.

<pre>a=1 b=2</pre>	
<pre>%Solution 1 temp=a; a=b; b=temp;</pre>	<pre>%Solution 2 [a,b]=deal(b,a)</pre>

131. (Python) To use one command to swap two columns (**b** and **c**) in **data**, we can use

```
temp=data['b'].copy()
data['b']=data['c']
data['c']=temp
```

#Solution 1

```
data['b'], data['c'] = data['c'].copy(), data['b'].copy()
```

#Solution 2

```
data['b'], data['c'] = data['c'], data['b'].copy()
```

#Solution 3

```
data[['b','c']]=data[['c','b']]
```

#Solution 4

```
data[['b','c']]=data.loc[:, ['c','b']]
```

#Solution 5

```
data.loc[:, ['b', 'c']]=data.loc[:, ['c', 'b']].values
```

#Solution 6

```
data.loc[:, ['b', 'c']]=data[['c', 'b']].values
```

132. (Python) To use one command to swap two rows (**b** and **c**) in **data**, we can use  
`data.loc[[b,c],:]=data.loc[[c,b],:].values`
133. (Python) To use one command to swap two rows (**mth** and **nth**) in **data**, we can use  
`data.iloc[[m-1,n-1],:]=data.loc[[n-1,m-1],:].values`
134. (MATLAB) To use one command (without using function **deal**) to swap two columns (**b** and **c**) in **data**, we can use  
`data(:,{'b','c'})=data(:,{'c','b'})` or  
`data(:,{'b','c'})=data(:,{'c','b'})`
135. (MATLAB) To use one command (without using function **deal**) to swap two rows (**b** and **c**) in **data**, we can use  
`data({'b','c'},:)=data({'c','b'},:)` or  
`data({'b','c'},:)=data({'c','b'},:)`
136. (MATLAB) To use one command (without using function **deal**) to swap two columns (**nth** and **mth**) in **data**, we can use  
`data(:,[m,n])=data(:,[n,m])` or  
`data(:,[m,n])=data(:,[n,m])`
137. (MATLAB) To use one command (without using function **deal**) to swap two rows (**nth** and **mth**) in **data**, we can use  
`data([m,n],:)=data([n,m],:)` or  
`data([m,n],:)=data([n,m],:)`

138. (MATLAB) To use **temp** (without using function **deal**) to swap two rows (**nth** and **mth**) in **data**, we can use

```
temp=data(m, :);
data(m, :)=data(n, :);
data(n, :)=temp;
```

139. (MATLAB) To use function **deal** to swap two rows (**nth** and **mth**) in **data**, we can use

```
[data(n, :), data(m, :)] = deal(data(m, :), data(n, :))
```

140. (Python) Use one command to compute and return the square root of every cell in **data** as a new dataframe, we can use

**data.apply(np.sqrt)** or **data.apply(math.sqrt)**

141. (Python) Use one command to compute the sum of every column in **data**, we can use

**data.apply(np.sum, axis=0)**. The return value is a ☐ DataFrame / ☒ Series.

142. (Python) Use one command to compute the sum of every row in **data**, we can use

**data.apply(np.sum, axis=1)**. The return value is a ☐ DataFrame / ☒ Series.

143. (Python) Use one command with the library function **pandas.DataFrame.apply** to use the following formula to compute and return a number on every column in **data**:

$(\text{value in row } 1)^2 + (\text{sum of all elements in the column})$

**data.apply(lambda x: x[0]\*\*2+np.sum(x), axis=0)**. The command returns a ☐ DataFrame / ☒ Series.

144. (Python) Use one command with the library function **pandas.DataFrame.apply** to use the following formula to compute and return a list on every row in **data**:

$[(\text{value in column d})^2, (\text{value in column c})^2 + (\text{sum of all elements in the row})]$

**data.apply(lambda x: [x['d']\*\*2, x['c']\*\*2+np.sum(x)], axis=1)**. The return value is a ☐ DataFrame / ☒ Series.

145. (Python) Continued from 144, with the parameter **result\_type='expand'**, the return value is a ☒ DataFrame / ☐ Series. List-like results will be expanded to columns of DataFrame.

146. (Python) Continued from 144, if the function returns a Series, the return value is a ☐ DataFrame / ☒ Series. Similar to 145, the resulting column names will be the Series index.

147. ☒ True / ☐ False (MATLAB) **B=rowfun(func,A)** applies the function **func** to rows in table **A**. The number of parameters in the function **func** should be the same as the number of columns in **A**. Each parameter denotes a column in **A**. The return value **B** is a table. To return a numeric vector instead of a table, use **B=rowfun(func,A,Name,Value)**.

148. ☒ True / ☐ False (MATLAB) **B=varfun(func,A)** applies the function **func** to columns/variables in table **A**. The function **func** is a one-variable function. The variable denotes the whole column. The return value **B** is a table. To return a numeric vector instead of a table, use **B=varfun(func,A,Name,Value)**.

149. ☒ True / ☐ False (Python) Complete the following table for basic operations on two rows/columns of **data**.

	DataFrame	Series	Numpy 2D array	Numpy 1D array
DataFrame	element-wise, aligned by labels	broadcasting, align DataFrame's column labels and Series' labels	element-wise, size must agree	use array as a row, broadcasting, element-wise, <b>size</b> must agree
Series		element-wise, aligned by labels	N.A.	element-wise, size must agree
Numpy 2D array			broadcasting, element-wise, size must agree	broadcasting
Numpy 1D array				element-wise, size must agree

150. (Python) Use one command to add the a row (e.g. the 1<sup>st</sup> row) to every row in **data** with **data** op row-Series

<pre>import pandas as pd data=pd.read_csv('HT001a.csv', index_col=0, header=0) print(data)</pre>					
<pre>   b  c  d  e a 0  1  2  3  4 1  5  6  7  8 2  9  8  7  6 3  5  4  3  2</pre>					
<b>data+data.iloc[0,:]</b>		b	c	d	e
	a				
	0	2	4	6	8
	1	6	8	10	12
	2	10	10	10	10
	3	6	6	6	6
<pre>import pandas as pd data=pd.read_csv('HT001b.csv', index_col=0, header=0) print(data)</pre>					
<pre>   b  a.1  d  e  1 a 2  1     2   3  4 4  5     6   7  8 3  9     8   7  6 4  5     4   3  2</pre>					
<b>data+data.iloc[0,:]</b>		b	a.1	d e	1
	a				
	2	2	4	6	8
	4	6	8	10	12
	3	10	10	10	10
	4	6	6	6	6

151. (Python) Use one command to add a vector to every row in **data** with **data** op 1D-array (or list)

<pre>import pandas as pd data=pd.read_csv('HT001a.csv', index_col=0, header=0) print(data)</pre>				
	b	c	d	e
a				
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2

<b>data+range (4)</b>  or  <b>data+np.arange (4)</b>	a	b	c	d	e
	0	1	3	5	7
	1	5	7	9	10
	2	9	9	9	9
	3	5	5	5	5

152. (Python) Use one command to add a column (e.g. the 1<sup>st</sup> column) to every row in **data** without changing the **id** of **data**.

<code>data+np.tile(data.iloc[:,0].values.reshape(4, 1), 4)</code>
<code>data+np.tile(data.iloc[:, [0]].values, 4)</code>
<code>data.apply(lambda x:x+data.iloc[:, 0].values, axis=0)</code>

153. (Python) Numpy array arithmetic operations: **array1** op **array2**

array1	array2	array1 + array2
(3,) 1D array	(3,) 1D array	<input type="checkbox"/> Error / <input checked="" type="checkbox"/> (3,) 1D array
(3,) 1D array	(4,) 1D array	<input checked="" type="checkbox"/> Error / <input type="checkbox"/> ( , ) 1D array
(3,4) 2D array	(3,4) 2D array	<input type="checkbox"/> Error / <input checked="" type="checkbox"/> (3, 4) 2D array
(3,3) 2D array	(3,4) 2D array	<input checked="" type="checkbox"/> Error / <input type="checkbox"/> ( , ) 2D array
(3,3) 2D array	(4,3) 2D array	<input checked="" type="checkbox"/> Error / <input type="checkbox"/> ( , ) 2D array
(3,4) 2D array	(3,1) 2D array	<input type="checkbox"/> Error / <input checked="" type="checkbox"/> (3, 4) 2D array
(3,4) 2D array	(1,4) 2D array	<input type="checkbox"/> Error / <input checked="" type="checkbox"/> (3, 4) 2D array
(3,4) 2D array	(4,) 1D array	<input type="checkbox"/> Error / <input checked="" type="checkbox"/> (3, 4) 2D array
(3,4) 2D array	(3,) 1D array	<input checked="" type="checkbox"/> Error / <input type="checkbox"/> ( , ) 2D array

154. (Python) Matrix multiplication using Numpy 1D/2D arrays.

Shape of <b>A</b>	Shape of <b>B</b>	Shape of <b>A@B</b>
( <b>M</b> , <b>N</b> )	( <b>N</b> , <b>P</b> )	( <b>M</b> , <b>P</b> )
( <b>M</b> , <b>N</b> )	( <b>N</b> , 1)	( <b>M</b> , 1)
( <b>M</b> , <b>N</b> )	( <b>N</b> , )	( <b>M</b> , )
(1, <b>N</b> )	( <b>N</b> , <b>P</b> )	(1, <b>P</b> )
( <b>N</b> , )	( <b>N</b> , <b>P</b> )	( <b>P</b> , )
(1, <b>N</b> )	( <b>N</b> , 1)	(1, 1)
( <b>N</b> , )	( <b>N</b> , )	( )

155. **Use one command** to compute the matrix multiplication, using the first 3 rows in **data** as the first matrix, and using the last row (without finding the number of rows) in **data** as the second 1-column matrix.

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 8 & 7 & 6 \end{pmatrix} \times \begin{pmatrix} 5 \\ 4 \\ 3 \\ 2 \end{pmatrix}$$

(3,4)                      (4,1)

<code>data.values[:3] @ data.value[-1]</code>
<code>data.values[:3] @ data.values[-1:].T</code>
<code>data.values[:3] @ data.values[[-1]].T</code>

156. ☒ True / ☐ False (MATLAB) MATLAB tables do not support arithmetic operations. We can use the dot syntax or `{ }-indexing/slicing` to obtain arrays. A 1D array is a 1-row 2D array. Matrix dimensions must agree or one is a scalar when applying arithmetic operation. There is no auto “broadcasting” except for the scalar.
157. (MATLAB) **Use one command** to add the first row of **data** to every row in **data**.

data =				
	b	c	d	e
0	1	2	3	4
1	5	6	7	8
2	9	8	7	6
3	5	4	3	2

data =				
	b	c	d	e
0	2	4	6	8
1	6	8	10	12
2	10	10	10	10
3	6	6	6	6

`data(:, :)=data(:, :)+repmat(data{1, :}, size(data,1),1)`

158. (MATLAB) **Use one command** to add the first row and the last column (without using the size of **data**) of **data** elementwise to every row in **data**.

`transpose(data{1, :})+data{:, end}`

159. (MATLAB) **Use one command** to add elements in the first column from the second row to the last row (without using the size of **data**) and elements in the second column from the first row to the second to the last row (without finding the size of **data**) element wise and return the result in a row array.

`transpose(data{2:end, 1}+data{1:end-1, 2})`

160. (MATLAB) MATLAB basic matrix operations.

matrix multiplication	$X*Y$	elementwise multiplication	$X.*Y$
matrix power	$X^Y$	elementwise power	$X.^Y$
matrix right division	$X/Y$	elementwise divide	$X./Y$

161. (MATLAB) **Use one command** to compute the matrix multiplication, using the first 3 rows in **data** as the first matrix, and using the last row (without using the size of **data**) as the second 1-column matrix.

`data{1:3, :}*transpose(data{end, :})`

162. (Python) **Use one command** to sort rows in **data** in-place by the 3<sup>rd</sup> column in **data** in ascending order.

```
data.sort_values(by=data.columns[2], axis=0, inplace=True) Or
data.values[np.argsort(data.values,axis=0)[: ,2] ,:]
```

163. (Python) **Use one command** to sort columns in **data** in-place by the 3<sup>rd</sup> row in **data** in ascending order.

```
data.sort_values(by=data.index[2], axis=1, inplace=True) Or
data.values[np.argsort(data.values,axis=1)[: ,2]]
```

164. (MATLAB) **sortrows(X, COL)** sorts the matrix **X** based on the columns specified in vector **COL**. To use the matrix **X** based on rows specified in vector **ROW**, we can use **transpose(sortrows(transpose(X), ROW))**

165. (MATLAB) **sort** works on matrices but not on tables. **sortrows** works on both matrices and tables. Therefore,

(1) to sort rows in **data** by the 3<sup>rd</sup> column, we can **use one command**:

```
data=sortrows(data,3)
```

(2) to sort columns in **data** by the 3<sup>rd</sup> row, we need to use two commands:

```
[y,I]=sortrows(transpose(data{: ,:} ),3) ;
data=data(:,I)
```

166. (MATLAB) When assigning values from one matrix to another matrix, e.g.

$A(J, K, \dots) = B(M, N, \dots)$ , the following must be true:

- The number of subscripts specified for **B**, not including trailing subscripts equal to 1, does not exceed `ndims(B)`. For example, if **B** is a 2x3x4 3D array, `ndims(B)=3`, `B(2,2:end,1:2,1,1)` is a valid indexing.
- The number of nonscalar subscripts specified for **A** equals the number of nonscalar subscripts specified for **B**. For example, `A(5,1:4,1,2)=B(5:8)` is valid because both sides of the equation use one nonscalar subscript.
- The order and length of all nonscalar subscripts specified for **A** matches the order and length of nonscalar subscripts specified in **B**. For example, `A(1:4,3,3:9)=B(5:8,1:7)` is valid because both sides of the equation (ignoring the one scalar subscript 3) use a 4-element subscript followed by a 7-element subscript.

In view of the above, in a 3x3 matrix **x**, we can use the following command to copy the 3<sup>rd</sup> column of **x** and paste it to the 2<sup>nd</sup> row of **x**.

```
x(2,:) = x(:,3)
```

167. ☒ True / ☐ False (Python) Slicing of Numpy arrays are views. In the assignment **slicing\_1=slicing\_2**, it is a good practice to use **.copy()** on **slicing\_2**. For example, in a 3x3 2D array **x**, to copy the 3<sup>rd</sup> column of **x** and paste it to the 2<sup>nd</sup> row of **x**, it will be nice to use **x[1,:]=x[:,2].copy()**.
